

## Assignment

-----

Below you will find a description of the app we would like you to make. It is based on data from VGs food site [Godt.no](http://www.godt.no).

[Godt.no](http://www.godt.no) is Norways most popular food website. The site contains food recipes, restaurant reviews, customer blogs/opinions and food articles.

It would be great if you can send us your solution before 09.00 tomorrow morning. It doesn't matter how finished your project is at this stage.

### App Description.

The task involves creating a list of the first 50 recipes in the godt api, containing title, image, description and ingredient names. The recipes can be read from a JSON feed:

<http://www.godt.no/api/getRecipesListDetailed?tags=&size=thumbnail-medium&ratio=1&limit=50&from=0>

It should be possible to search for a recipe based on the ingredients or title of the recipe and the app should work offline after parsing the feed for the first time.

You can ignore any fields in the feed not relevant to the task.

You are also free to choose which versions of the OS and devices you wish to support.

Please send over a description of what you have done and any comments or suggestions for a person to evaluate your solution and ideas.
